

Fishbowl

Fernando Muñoz

What is Research for health?

- The key is in the word “for”.
- Looks as a new denomination for Essential Health Research.
- Research on the field of Health that:
 - Addresses a relevant health problem
 - Answers an important and previously unsolved question
 - Produces knowledge or tools useful for better facing the problem and increase people’s well being
 - It is sound enough for trusting results

How is research used in technical cooperation? Where? PASB or general public?

- Research should be used to encourage countries to replicate research findings that could be useful for better facing their problems.
- PASB should use research to improve and increase quality of cooperation
- The general public should be the end beneficiary of research. Hopefully, scientific literacy should be enough for people be conscious of the role of research in benefiting the community.
